## **Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) A method for multi-spectral image capture of a first scene, the method comprising:

acquiring a first series of images of the first scene with one or more image acquisition systems, each of the image acquisition systems having an imaging sensor which has a set of color filters thereon and has two or more color channels, each of the channels having a different spectral sensitivity;

filtering each of the first series of images of the scene with a different filter from a set of non-interference, color filters, each of the non-interference filters in the set of the non-interference filters having a different spectral transmittance and is positioned between the scene and the one or more image acquisition systems; and

acquiring a second series of images of a second scene with the one or more image acquisition systems; and

filtering each of the second series of images of the second scene with a different filter from the set of filters;

generating a characteristic mapping from two or more color channel signals from the second series of filtered images; and

generating a multi-spectral scene description from two or more of the acquired first series of filtered images.

- 2. (Cancelled).
- 3. (Cancelled).
- 4. (Cancelled).
- 5. (Currently Amended) The method as set forth in claim [[4]] 1 further comprising generating a spectral reflectance of the first scene from the multi-spectral scene description and the characteristic mapping.
- 6. (Original) The method as set forth in claim 5 further comprising using the generated spectral reflectance to reproduce the first scene.

- 7. (Original) The method as set forth in claim 5 further comprising storing the generated spectral reflectance for the first scene.
- 8. (Previously Presented) The method as set forth in claim 1 further comprising illuminating each image of the first series of images with one or more illuminants.
- 9. (Previously Presented) The method as set forth in claim 1 further comprising illuminating each image of the first series of images with an illuminant from a set of two or more illuminants as each of the first series of images is being acquired, each of the illuminants having a different spectral power distribution.
- 10. (Previously Presented) The method as set forth in claim 1 wherein the set of non-interference filters comprise at least one of an absorbance filter, a writable filter, and a liquid crystal tunable filter.
- 11. (Previously Presented) The method as set forth in claim 10 wherein the non-interference filters are the absorption filters.
- 12. (Currently Amended) An apparatus for multi-spectral image capture of a first scene, the apparatus comprising:

one or more image acquisition systems each having an imaging sensor which has a set of color filters thereon and has two or more color channels, each of the channels having a different spectral sensitivity, each of the image acquisition devices acquiring a first series of images of the first scene;

a set of non-interference, color filters, each of the non-interference, filters in the set of the non-interference filters has a different spectral transmittance, is positioned between the scene and the image acquisition system, and filters a different image in the first series of images; and

a spectral image processing system which generates a multi-spectral scene description from two or more of the acquired first series of filtered images, the image acquisition systems acquires a second series of images of a second scene, the set of filters

filter each of the second series of images of the second scene with a different filter, the spectral image processing system generates a characteristic mapping from two or more color channel signals from the second series of filtered images.

- 13. (Cancelled).
- 14. (Cancelled).
- 15. (Cancelled).
- 16. (Currently Amended) The apparatus as set forth in claim [[15]] <u>12</u> wherein the spectral image processing system generates a spectral reflectance of the first scene from the multi-spectral scene description and the characteristic mapping.
- 17. (Original) The apparatus as set forth in claim 16 further comprising a printing device to reproduce the first scene based on the generated spectral reflectance.
- 18. (Original) The apparatus as set forth in claim 16 further comprising a memory device for storing the generated spectral reflectance for the first scene.
- 19. (Previously Presented) The apparatus as set forth in claim 12 further comprising one or more illuminants which illuminate each image of the first series of images.
- 20. (Previously Presented) The apparatus as set forth in claim 12 further comprising-a set of two or more illuminants, each of the illuminants having a different spectral power distribution and illuminating one of the images of the first series of images.
- 21. (Previously Presented) The apparatus as set forth in claim 12 wherein the set of non-interference filters comprise at least one of an absorbance filter, a writable filter, and a liquid crystal tunable filter.
- 22. (Previously Presented) The apparatus as set forth in claim 21 wherein the non-interference filters are the absorption filters.

23-36 (Canceled).

37. (Previously Presented) A method for multi-spectral image capture of a first scene, the method comprising:

acquiring a first series of images of the first scene with one or more image acquisition systems, each of the image acquisition systems having an imaging sensor which has a set of color filters thereon and has two or more color channels, each of the channels having a different spectral sensitivity;

illuminating each image of the first series of images with a different illuminant from a set of two or more illuminants, each illuminant having a different spectral power distribution;

generating a multi-spectral scene description from the acquired first series of filtered images;

acquiring a second series of images of a second scene with the one or more image acquisition systems;

illuminating each of the second series of images of the second scene differently; and

generating a characteristic mapping from the second series of filtered images.

38-40. (Canceled).

- 41. (Previously Presented) The method as set forth in claim 37 further comprising generating a spectral reflectance of the first scene from the multi-spectral scene description and the characteristic mapping.
- 42. (Original) The method as set forth in claim 41 further comprising using the generated spectral reflectance to reproduce the first scene.
- 43. (Original) The method as set forth in claim 42 further comprising storing the generated spectral reflectance for the first scene.

44. (Previously Presented) An apparatus for multi-spectral image capture of a first scene, the apparatus comprising:

an image acquisition system having an imaging sensor which has a set of color filters thereon and has two or more color channels, each of the color channels having a different spectral sensitivity;

a set of two or more illuminants, each illuminant having a different spectral power distribution and illuminating one of the images of the first scene; and a spectral image processing system which generates a multi-spectral scene description from the acquired first series of filtered images;

wherein the image acquisition systems acquire a second series of images of a second scene and the set of color illuminants illuminate each of the second series of images of the second scene with different spectral power distribution;

wherein the spectral image processing system generates a characteristic mapping from the second series of illuminated images.

## 45-47. (Canceled).

- 48. (Previously Presented) The apparatus as set forth in claim 44 wherein the spectral image processing system generates a spectral reflectance of the first scene from the multi-spectral scene description and the characteristic mapping.
- 49. (Original) The apparatus as set forth in claim 48 further comprising a printing device to reproduce the first scene based on the generated spectral reflectance.
- 50. (Original) The apparatus as set forth in claim 48 further comprising a memory device for storing the generated spectral reflectance for the first scene.

51-70. (Canceled).
